About the "Humanization of Money"

and

Basic Principles of a Globally Agreeable Economy in Harmony with the Laws of Life:

Charly Rainer Ehrenpreis

1. The Global Situation

Today all of humanity is living in the system of global capitalism, predominantly based on the maximization of profit by the means of exploiting a large part of humanity and nature. The only thing this system cares about is to make the highest profits possible, given the current circumstances, as quickly as possible, regardless of the cost of life on this planet.

Ever since World War I at the latest this motive has driven human beings to ever increasingly create a colossal war society, utilizing the function of money. War is used to keep up the capitalist economic system. More than that: It needs war in order to work - war between peoples aided by a giant arms industry, and war between people against nature with the help of an equally giant chemical and technological industry. Every current economy depends on the modern industries of arms production and post-war reconstruction. Since the globalization of the financial market all members of the money-based society are a part of this system.

Edward Goldsmith, editor of “Blackbook of Globalisation” (Schwarzbuch der Globalisierung), impressively describes the current situation of humankind in the book’s last chapter. A short summary of his analysis follows:

In 1995 when the World Trade Organisation WTO was founded at the so-called Uruguay Circle to become the most important instrument of globalisation, one told the people that globalisation would happen to the benefit of all creatures on earth. Many believed that since the reasoning made sense and globalisation was “in the air” (e.g. as a consequence of the Internet) it was the logical next step in the development of humankind. It is a fact, however, that the gap between the poor and the rich has increased continuously since then, the environment pollution has worsened, and criminality, unemployment, mal-nutrition, homelessness and diseases continue to grow.

This is mainly due to the fact that most local economies broke down under the pressure of globalisation. Hardly any former subsistence economies can survive under the competitive pressure of multinationals; no development country can in fact develop under the conditions of the IMF and the World Bank. With the increasing disappearance of local autonomies the social holding together of tribal societies (amongst indigenous peoples) and communitarian entities in the western world have also disappeared. Their traditional social functions ceased to exist, causing huge problems such as the care of the elderly and sick people, increased criminality etc. Well, globalisation has an answer to this problem too: privatisation of all the social functions which had until been carried out by existing
communitarian entities. Since these social services now have to be paid, the cost of living for almost all people has increased with the exception of a few rich people who are making money with this system. Simultaneously something like an atomisation of the society starts; i.e. complete privatisation and the isolation of the individual.

Just a hundred years ago social functions were still carried out by big families, communities or parishes. Within these communitarian entities people provided for their basic needs by themselves: their necessary food as well as the clothes, child rearing, care of the elderly and the sick, and the social order (including jurisdiction). This “social economic system” worked almost entirely without money! It was based on the “social capital” of communities and communitarian entities.

Globalization transformed all social activities into commodities; they are privatized, i.e. given into the hands of multinationals so that they can be globally marketed and negotiated. This process, however, isolates these activities form their natural social context, i.e. they are being deprived from their souls.

The same thing globalization does to social bonds it also does to ecological bonds in natural cycles and biotopes. Highly complex ecosystems are destroyed at an increasing rate in favor of less complex mono cultures, industrialized agricultures and over-dimensioned water reservoirs, with the well known results of the greenhouse effect and climate change.

In one sentence: Globalisation replaces the social services of local communitarian entities with the global money economy and the natural function of the biosphere with a technology which is not in harmony with nature.

This process is also based on the increased dissolution of local communitarian entities (big families, tribal communities, parishes) into a mutilated form of the nuclear family. They are no longer autonomous social and economic unities, therefore de-rooting human beings fundamentally from their meaning of life. Also, the term 'democracy' is mutilated when original social entities no longer exist. In our contemporary mega systems the individual has hardly any possibility to determine his or her life. In addition, nowadays worldwide effective political decisions are no longer made by individual states. This practice was discarded with the installation of the WTO, international trade agreements, etc., in favour of a “de-facto world government” (WTO, G-8-summit meetings, Davos etc.) which makes decisions beyond parliamentary or democratic legitimation, hardly making themselves accessible to the public. In this way it becomes less and less transparent how much pressure multinationals put on the politicians who are making decisions, obscuring that it is them – and only them – who are the big winners of globalization.

Consequently, real democracy is based mainly on the re-introduction of local and economic autonomy. This includes routing the people in the place they live, the production of their food, their clothes and their houses. It also includes re-integrating human beings into the natural ecological systems they live in and the autonomous administration of their resources (land, water, air, animals, plants, etc.). “Only if and when this whole community is healthy also its members can remain mentally and physically healthy in a sustainable way. “ (Wendell Berry, based on Edward Goldsmith). Only in this way will it also be possible to let the environment be what it is in a sustainable way: it is the elementary basis of life which keeps us alive. Local economic systems can take much more responsibly to administer energy and
resources in a sustainable and comprehensive way. Additionally, care taking for the needy (elderly or sick people) can be re-integrated into local social systems.

Many people will have to learn once again how to survive outside the globalised economy. Autonomous communitarian entities will have to emerge, bringing the fulfilment of their needs of living back into their own hands. Those communitarian entities will not “develop backwards” though, they will make use of the natural inventions of our times such as decentralised production of energy, insights from modern ecology, nature-harmonious building, alternative medicine, etc.

This amplified anti-globalisation movement, this “party of communities”, will at first have little financial resources and power but in the course of time the number of their members will increase by necessity. “If such a party came to power, it could develop and realise coordinated strategy for a less painful transition towards the kind of society and economy which will be able to offer our children some future on this threatened planet earth”(Wendell Berry, based on Edward Goldsmith).

That is as far my summary of Edward Goldsmith's analysis goes.

2. Basic Ideas about an Economy in Harmony with the Laws of Life:

What we need for a new economy are new self-sufficient communitarian entities, which we call “Healing Biotopes” or “Peace Research Villages”. In these vessels people re-learn to become aware of their sources and their cosmic origin, to get to know the natural resources of their lives more deeply, and to protect, to honour and to sustainably consolidate them within themselves. Such places need a completely new perception of the economy of life.

The new peace culture which will develop from the cooperation between these peace research centers is going to give a whole new meaning to money. How will the role models for this new economy be found?

There is an economy of nature, and this economy has been developed over millions of years in the course of evolution: Wouldn’t it be recommendable for us to take this kind of economy as an example to develop an economy for humanity?

What are the basic principles of nature? How do living beings organise their co-habitation naturally and in cooperation with their surroundings in order to build small but stable biotopes and cycles in bigger dimensions?

Some of these basic principles are:
1. Building systems with maximum complexity to reach utmost stability.
2. Connecting or combining these systems to reach ever higher levels of order by means of this increasing complexity.
3. To be able to do this, all systems of nature are systems which are open towards the whole – not closed systems.
4. They dispose of a high degree of decentralisation and job-sharing.
5. Symbiosis: mutual support by means of exchanging “waste products” which are nutritional for others.

A beautiful and simple example for this is the air we breathe: Plants “exhale” oxygen and “inhale” carbon dioxide, animals and people do the exact opposite. They need
the oxygen exhaled by the plants, exhaling the carbon dioxide the plants need in
turn. This is a simple form of global symbiotic support.
6. No equivalence of giving and taking, but rather the building of the greatest possible
energy, information and material cycles for the best possible sustenance for all
participants.
7. Adjustment of the living being to the individual environmental conditions (flexibility).

Without these principles of evolution a constant upward development of life on earth
wouldn't have been possible at all.
The very ecology which evolved in this process as the interplay of living beings
developed certain basic economic principles and structures:

1. The building of self-sustainable systems or biotopes (autonomy or self-sufficiency).
2. The development of ever bigger networks of interplay towards the construction of a
communitarian atmosphere as the living condition for all living beings.
3. The biotopes work predominantly in a decentralised way, based on the division of
labour whereby their members mutually foster each other by means of their individual
special qualities (symbiosis).
4. Nature doesn’t know “waste”.
5. “Trade” doesn’t balance what one member gives and what it receives from the
whole – each member automatically gives all it has to give.
6. In case one member lacks something it is, to a certain extent, flexible enough to
adjust to the new conditions.

A new economy of human beings that follows these principles is first and foremost a
gift economy. Georges Bataille developed such an economy when he perceived the
sun to be the biggest giving organ of our cosmic environment. It gives itself without
limits thus enabling the development of all life on our planet. Also, living creatures
give away everything they don’t need for themselves, and in turn they receive
everything that they need for living. It is this basic principle of giving which provided
for Jesus to say the following sentence with scientific precision: “Behold the fowls of
the air: for they sow not, neither do they reap, nor gather into barns; yet your
heavenly Father feedeth them.” It is not a biblical miracle but the result of millennia of
evolution. Only when the ecological cycles of nature are destroyed to the extent they
have been by human beings until now, will this principle no longer be applicable to
and work for the living beings. It is not the fault of evolution when animals die of thirst
or hunger in the desiccated zones of Africa, but rather it is the deed of the human
being who decided to act consciously or unconsciously against nature.

Firstly, the economy of nature is the unconditional giving of all that is not needed for
survival.
Secondly, it is the creation of sufficiently complex, well reflected systems of lasting
self-sustainability. Autonomy is a paradigm that guarantees the survival of biotopes.
In the same way, decentralisation and work sharing are essential features of a
functioning biotope: each member of the biotope “knows” exactly what it has to do,
what it has to give, what it needs from the whole, and with whom or what it is
symbiotically connected.

It doesn’t account for its giving and taking in the direct sense; what we call money
doesn’t exist in nature in this way. All the same there is something like an ‘economic
consolidated balance sheet’, a ‘general gross product of nature’ and both are positive
because so far the development of life [evolution] has always moved towards ever higher complexity, towards the creation of an ever growing general balance of ‘inner’ energy and consciousness on earth (Teilhard de Chardin).

Let’s try to become fully factual: A new economy of humankind is based on the gifting interplay of autonomous centers. Eventually money will no longer be needed, not even as a means of exchange or payment, for there will be nothing that ought to be paid for.

At this point we have arrived where the economy of life on earth assimilates to the actual essence of love. In the end the one who loves doesn’t ask what she or he gets in return. When there is resonance in love – and love always bases on resonance – we will receive what we are searching for or what we need. Right now or later. The question is merely about how wide or how big one can see and experience the field of one’s own power of love. Watched from a distance with a clear perspective, love in a community such as a healing biotope, always happens on a higher level of order; it is “like a fireball” and wants to be passed on, in the same way the sun gives its light and warmth.

The Beatles sang “Can’t buy me love”, and I would like to add: “but it is given to you when you understand the rules of the game”.

When we re-learn to give and to allow ourselves to receive in the areas of money or profession we will also re-learn this in the area where it seems most difficult: the area of love. Giving love from the abundance of the heart, that’s true affluence and certainly also a part of the entelechy of every human being.

3. The Connection of Money and Love

The connection between love and money is very deep: The notions about economy that we create are determined by our experience in love.

The human economy we know makes the cycles of giving and taking very small. As a rule two people negotiate with each other what they consider to be equivalent; giving and taking have become the private issue of a small mental cycle – the same as in love. The way human beings act in the area of love and the way they act in the area of money are in the end the same, as our habits in the area of money are a result of our experiences in the area of love. The decisive question in both cases is in how far we dare to integrate ourselves in the bigger cycles of the universal existence of ourselves.

We are not yet really capable of imagining a planetary gift economy as we are accustomed to mistrust, calculation, fear, disbelief etc..

Disbelief in the area of money results from the fact that we translate everything that we experience in the areas of love and trust to the area of money. And as the experience in love has been very painful, our contemporary capitalism and war society developed from this wounded psychological basis.

When the expansion of love began to be suppressed it couldn’t grow anymore. Therefore the thought of revenge and destruction against everything that exists
developed deeply inside of the human being. This is why our environment is so destroyed.

When love couldn’t grow and give itself any longer, nature and its evolution started to be rejected and the idea of ‘private’, private property, came up - not only regarding one’s own wallet but also regarding all the gifts (resources) of planet earth. This is what we now experience to be the globalisation of private property.

When love couldn’t grow any more people started to calculate, started to reckon: how can I get the best of everything for myself now, how can I secure myself, insure myself? How can I tailor my private happiness with what I can get for myself? This was when human beings started to fear and dominate each other.

When love can grow again, however, when a peace culture that helps restore our original trust for creation and love for human beings begins to grow, we will no longer reckon, we will no longer calculate; then we will fully dedicate ourselves to the development and the blossoming of more such places of trust on this planet. We will do this to our benefit and to the benefit of those we love.

Once we have reached the ground of our spiritual anchor and love the question of economy will have dissolved by itself: why shouldn’t we freely give everything to a world whose being and whose essence we love? The building of Healing Biotopes and Peace Research Villages is a first step in the creation of such a world, beginning on a small scale. Thus, the internal economy of a Healing Biotope will be characterised by the idea of communitarian property (i.e. the abolition of private ownership). At first, this refers to all the communitarian possessions, mainly: the appreciation, care taking and maintenance of the terrain, buildings and its infrastructure. Gradually, it also refers to all services, which members will provide for the community without pay, for the communitarian entity takes care of the needs of all its members.

A brief historical insertion: In the history of our project we received almost all of our financial means through donations and gifts, and we are very grateful for that. We call this economic principle "spiritual economy" because in this context money flows along certain spiritual lines and not along the normal lines of direct equivalents. Of course, to go for this kind of economy requires a considerable amount of faith and trust. We practised this in our project from the very beginning and experienced a lot of miracles, and in the same way we created miracles for others, too.

4. The Transition: Humanization of Money

On one hand we are living in times of capitalism and war, on the other hand we have the vision of the gift economy in a new peace culture. But how do we get from here to there?

In these transition times the concept of the “humanization of money” is essential. As long as there is money we must do everything in our power to see that it is invested in a new peace culture.

Here is an interesting statement from Pia Gyger, co-founder of the Swiss Lassalle-Institute:
“Humanity must learn and practice peace with the same dedication as they do war. Unless we invest the same financial resources into peace research and peace education, peace will remain an illusion. As soon as we invest our mental, spiritual and material powers to learn peace, the "historical wheel of war" will start to turn into the opposite direction”.

To substantiate this quote in figures I want to add two price examples in the arms industry:
1) A new Leopard-2-tank from the German arms factory Krauss-Maffei costs about 10 Million Euros. Depending on the country, the same amount could finance a few peace research villages for several thousand people to live and research peace.
2. A stealth bomber costs 1.5 Billion USD, which could finance about a thousand peace research villages for several hundred thousand people all over the world.

If the money that is now being invested into the arms industry was invested in the creation of a peace culture, the settlement of planet earth would look very different very soon.

We assume that the new peace culture is going to develop from a few models (peace research villages) in the different regions of planet earth. Peace research villages are places were the basic features of a new peace culture are being researched and developed. Here people can learn the fact that and the way how another life is possible. As soon as these models are working they will function as a crystallization impulse for the development of further models and, in the end, for a completely new peace culture.

These models will be autonomous to a large extent, ecologically as well as socially. Furthermore, nowadays far-reaching economic autonomy is a must for setting the right course for the creation of a new model of living. In times of transition economic inventions like regional currencies and “trade rings” (Local Exchange Trading Systems), which ensure that money stays within the region, are groundbreaking just like regional networks for an autonomous supply with water, food and energy. This process will strengthen regionalization, increase neighborly support and lead to a far-reaching independence from global markets.

Autonomy (or self-sufficiency) is not to be (miss-) interpreted as “back-to-nature”, rather as the full use of the regional affluence, the integration of sustainable technology, and the building in harmony with nature and ecological intelligence. In the area of integrated knowledge the invention “Open Source” is worth mentioning: a worldwide network of specialists working together on complex developments without remuneration. This could one day also lead to overcoming the concept of patent rights. Technological know-how must be generally available for everyone; this is the only way humanity can grow together in peace and cooperation.

Creating these regional networks and infrastructures needs financing. Each investment towards this goal is a direct investment for the future of independent but open biotopes. As long as money and a regulated economy still exist the only positive function of money is investment towards the building of regional structures which re-enable people to live in a meaningful way, connected with nature.

“Humanizing Money” means that money is being invested towards the development of these regional networks and appropriate living models (peace research Centers) to spread the idea infectiously on a global scale.
With “investments” we don’t mean investing money to create a financial return after a certain period of time. The return, rather, lies in the creation of a new quality of living and a new culture. When peace projects are successful the peace creating intelligence and healing forces on earth will multiply, as well as the awareness for the need of a genuinely non-violent culture. And, the possibilities will multiply for ever more people to lead meaningful, healing and fulfilled lives. Thus, an “investment towards peace” does not create a financial return but rather a return that serves peace and the creation of new living structures. Future generations will be grateful for it.

Together with Sabine Lichtenfels, in 2008 I founded “GRACE – Foundation for the Humanization of money”, a non-profit foundation in Switzerland. With the help of this foundation we collect money internationally to pass on to the worldwide building of peace research models. So far we have mostly been financing the creation of the Peace Research Center Tamera in Portugal, the Peace Community San José de Apartadó in Columbia, the construction of their new center in Mulatos, the development of the “Global Campus” and its training and education spaces for inner and outer peace work, and the annual GRACE-pilgrimages with which we support cooperating peace initiatives in Israel/Palestine and Columbia.

Once more: as long as the current financial system exists one of the tasks of every peace initiative is to ensure that as much money as possible is detached from the system of violence (including banking systems) and flows into the creation of peace models.

5. Summary

1. Today all of humanity is living in the systems of global capitalism and war, economy is dependent on war to exist. In our vision of a future peace culture we need to think about what meaning money is supposed to have.
2. When we look into nature we discover a global economy of exchange which supplies each element with what it needs to live via an amazingly complex network of open cycles. The economy of a new peace culture is therefore going to be a gift economy.
3. Our fears and mistrust, which have been preventing such a system, have been caused by our first experiences in the area of love. We have transferred these experiences to the system of money. Just as much as we need to learn to give and trust in the area of economy we can and have to re-learn it in the area of love.
4. If the money that is currently being invested into the war industry was directed into the development of a peace culture the settlement of our planet would very quickly look very different. The transition from war society to a peace culture will only succeed if enough money is invested into the development of peace models as “crystallization impulses” towards a global field of peace. We call this process the “Humanization of Money”.

6. Closing Words

To summarize I want to repeat the core statements of this text:
The notions of economy that we create for ourselves are characterized by our experiences in love.

“When the expansion of love began to be suppressed it couldn’t grow anymore. Therefore the thought of revenge and destruction against everything that exists developed deeply inside of the human being. This is why our environment is so destroyed.

When love couldn’t grow and give itself any longer, nature and its evolution started to be rejected and the idea of ‘private’, private property, came up - not only regarding one’s own wallet but also regarding all the gifts (resources) of planet earth. This is what we now experience to be the globalisation of private property.

When love couldn’t grow any more people started to calculate, started to reckon: how can I get the best of everything for myself now, how can I secure myself, insure myself? How can I tailor my private happiness with what I can get for myself? This was when human beings started to fear and dominate each other.

When love can grow again, however, when a peace culture that helps restore our original trust for creation and love for human beings begins to grow, we will no longer reckon, we will no longer calculate; then we will fully dedicate ourselves to the development and the blossoming of more such places of trust on this planet. We will do this to our benefit and to the benefit of those we love.”
